RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 142 pages. Dimensions: 9.7in. x 7.4in. x 0.3in. This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1893 edition. Excerpt: . . . receptacle and as the positive electrode. (The alkaline nitrates melt at about 200 C. , but do not decompose until at from 1000 to 1200 C. Up to this point not only do they not attack metal vessels which contain them, but they appear, on the contrary, to have the singular property of preventing oxidation by fire, or at least of retarding the same considerably. ) The coke is held by an iron wire which also serves as a terminal. With the nitrate in a fused state a current of E. M. F. from 1 to 2 volts is produced. If instead of nitrate in fusion an aqueous solution of the salt be employed, the poles are reversed. In fact, in an iron-carbon couple using a solution of soda or potash nitrate the iron is positive and acts like the zinc in the ordinary cell. Brard Brick (1882). --This is an agglomerate of ordinary carbon on which is placed a tablet composed of a mixture of nitrate of potash and cinders and separated by an interposed sheet of asbestos paper. The poles are metallic rods which traverse the carbon and nitrate and protrude from one end of the brick. If the end of the brick opposite to the terminals be placed in the fire, the carbon becomes red hot, the nitrate melts and the current is established, weak at first but gradually stronger, until finally a maximum is reached which remains constant as long...
